Management Guidelines for Adult Nurse Practitioners

The Medical Outcomes & Guidelines Sourcebook
The only pharmacology resource specifically written by and for nurse practitioners, this new edition provides a greater emphasis on prototype drugs while retaining its comprehensive approach to the pharmacology content needed by the primary care provider. New features include prototype drug lists in the coverage of drug classes that receive expanded coverage, detailed patient teaching guidelines, expanded content in both the geriatric and pediatric chapters, a special icon identifying the Top 200 Drugs, and highlighted Clinical Alerts. Comprehensive coverage is provided of all drugs commonly prescribed and used in the primary care setting. Prototype drugs are presented first in each drug class, with expanded coverage of these agents. Clear explanations describe how each drug in a class differs from its prototype. Detailed information shows how to provide effective patient teaching, as well as how to gain patient compliance. Chapters focus on the practitioner's role in patient teaching, drug action, and drug therapy. Online Resources are provided at the end of each chapter. The Top 200 Drugs are described according to the number of U.S. prescriptions dispensed. Five new units improve the organization of material: Renal/Genitourinary Agents (Unit 8); Psychotropic Agents (Unit 11); Endocrine Agents (Unit 12); Female Reproductive Agents (Unit 13); and Health Promotion (Unit 15). New chapters examine over-the-counter medications, compliance and the therapeutic experiment, overview of the nervous system, substance abuse, treatment of common infections, weight management, and complementary and alternative treatments. Reorganized and redesigned format and headings are more consistent and easy to follow. Content has been expanded in the geriatric and pediatric "special populations" chapters (Ch. 6 and 7). More concise coverage of disease processes features clearer ties to the Mechanism of Action sections. 25 new figures have been added to the pathophysiology and Mechanisms of Action sections. A Table of Common Interactions is included on the inside of the back cover.

Public Health Reports

This new book focuses on statins which are a relatively new group of drugs used to lower blood cholesterol levels. A high cholesterol level increases a person’s risk of having a heart attack or stroke. The long-term use of statins reduces the risk of such an event and can increase the life expectancy of people with a history of heart disease. The statins work by blocking an enzyme in the body that is involved in the production of LDL cholesterol, especially in the liver. This enzyme is known as HMG coenzyme A reductase. The statins are the most effective group of drugs for lowering the levels of LDL cholesterol in the body. Potential side-effects include muscle cramps and gastrointestinal upsets. These are usually resolved on temporarily lowering the dose. Liver enzyme derangements may occur, which generally return to normal after briefly discontinuing the drug. Some report headaches. Other side-effects occur rarely.

Clinical Practice Guidelines Directory, 1999
Patients with two or more risk factors have a very high risk of developing cardiovascular disease. It follows that the strategy for the intervention of multiple risk factors is in fact of paramount relevance in detecting patients at high risk of cardiovascular disease requiring therapeutic intervention. The text also discusses risk factors from the point of view of biochemists and pharmacologists by addressing the mechanisms underlying the onset of hypertension, hyperlipoproteinaemia, hypercoagulability and the possibility of therapeutic intervention.
